

Introduction to Artificial Intelligence and Machine Learning

Dr. Manju Venugopalan

Dept of CSE

ASC Bangalore

What makes us human ?

- What makes us uniquely human?
- We are intelligent, what then, is Artificial Intelligence ?

Reason

Transfer

Artificial Intelligence (AI)

AI -

Algorithmic strategies that try to match or exceed the capabilities of humans

Applications Domains:

Computer vision

Natural Language Processing

Text to speech

Motion – Robotics

Artificial Intelligence

Machine Learning

Supervised Learning

Unsupervised Learning

Reinforcement Learning

Deep Learning

Machine Learning (ML)

Machine learning (ML)

Arthur Samuel coined the term in 1959

- "Learning" Not explicitly programmed
- Prediction or decisions based on data
- More data – more accurate results

What, then, is deep learning
?

Deep Learning (DL)

Deep learning is a subset of
ML

- Neural networks – Nodes and statistical relationships between nodes to the way our mind works
- One layer – Approximate predictions
- Additional layers – Optimize and refine for accuracy
- "Deep" - Multiple layers (More than 3 layers)
 - o Eliminates some pre-processing
 - o Better with unstructured data

MACHINE LEARNING

Artificial Intelligence

Machine Learning

Supervised Learning

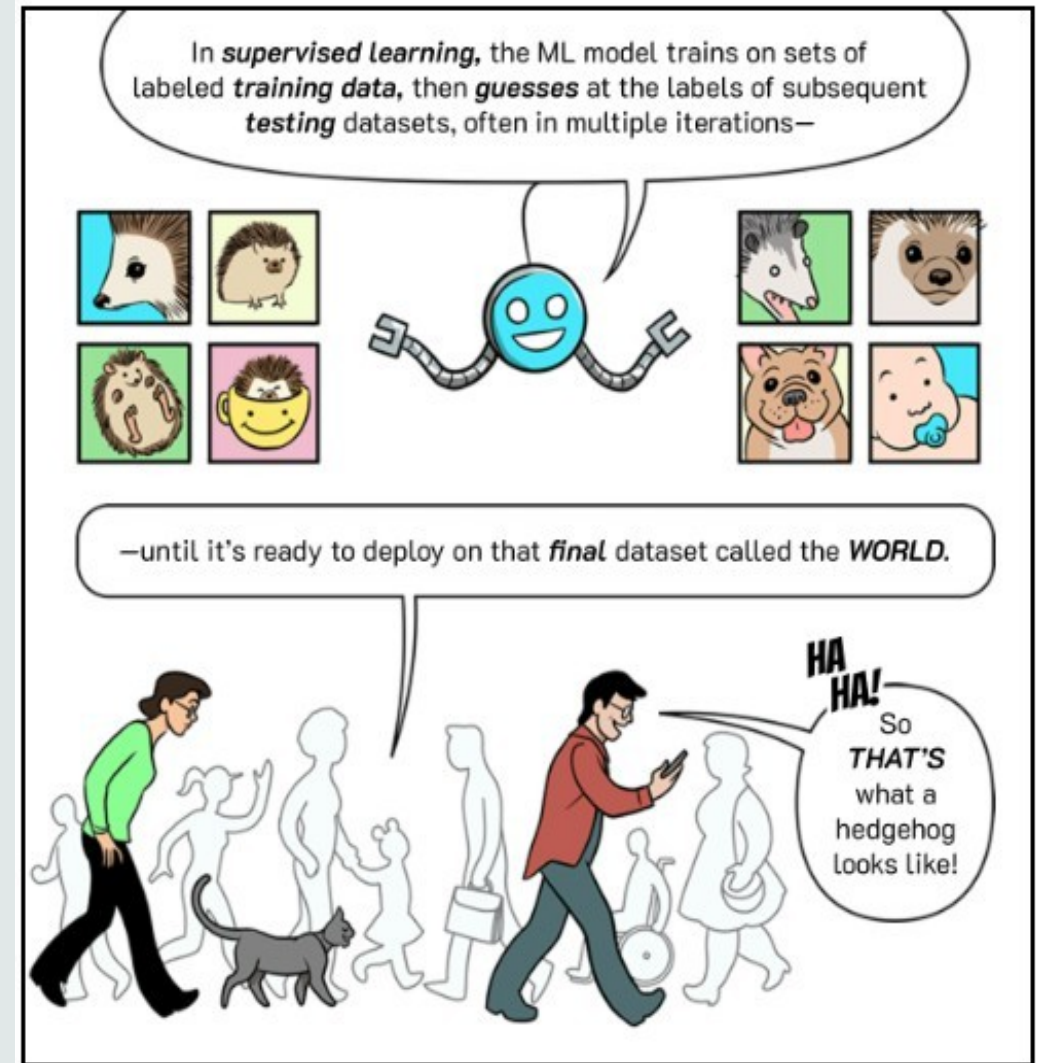

Unsupervised Learning

Reinforcement Learning

Deep Learning

Supervised learning

- Has a defined mapping from input to output
- The model learns this mapping from paired input/output data examples

Some terms used

- Regression - continuous numbers as output
- Classification- discrete classes as output
- Binary classification– two classes treated differently
- Multiclass classification – Multiple classes treated differently

Image

classification

- Binary or multiple discrete classes

- Defect detection
- Security surveillance
- Biometrics

Example Classifier:

- Convolutional Neural Network

Text Classification

- Spam detection
- Movie / restaurant reviews
- Binary classification (two discrete classes)
- Naïve Bayes, Support Vector Machines (SVM)

Handwriting Recognition

- Postal addresses
- Banking solutions

Example Classifiers

- Convolutional Neural Networks (CNN),
- Long Short-Term Memory Networks (LSTM)

Regression

- **Real value output**
- Housing rent calculation
- Credit scoring
- Stock price forecasting
- Sales prediction
- Linear Regression, Support Vector Regressor, Neural networks

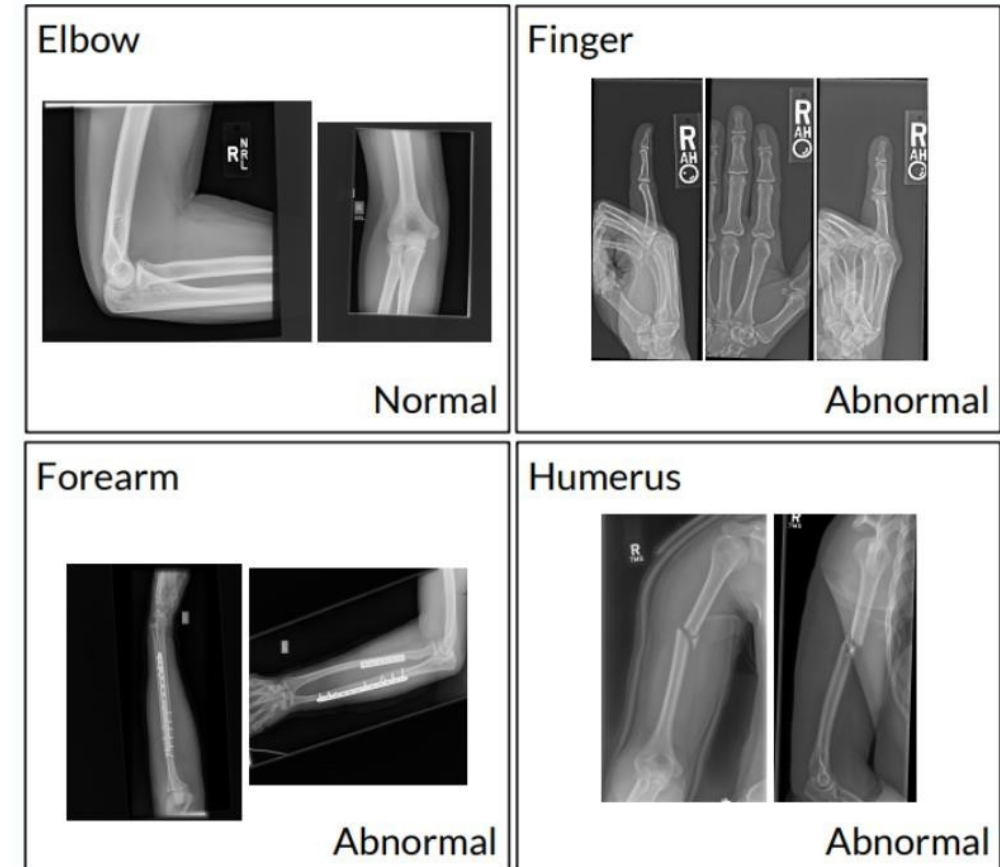

Medical Diagnosis

- Classification – Binary or multi-class
- Prediction of severity – Regression
- Image Segmentation – Tumor
- Depends on the data and task

Classifiers

- CNN, Random Forest(RF), SVM, LSTM, CNN-LSTM

Artificial Intelligence

Machine Learning

Supervised Learning

Unsupervised Learning

Reinforcement Learning

Deep Learning

Unsupervised learning

Learning about a dataset without labels

- Clustering
- Finding outliers
- Dimensionality reduction
- Generating new examples
- Filling in missing data

Clusterin

g

Filter 0

Filter 33

Filter 145

Filter 194

Filter 97

Filter 116

Filter 119

Filter 182

- Document retrieval
- Customer preferences – Retail
- Social media analysis
- Find patterns in data

Finding outliers

- Banking alert systems
- Surveillance
- Network traffic anomaly

Classifiers

- SVM, Autoencoders

Meow Generator

- Generated realistic images of cats in 2-3 hours
- Used Cat dataset
(<https://web.archive.org/web/20150703060412/http://137.189.35.203/WebUI/CatDatabase/catData.html>)
- Different types of GAN used in a semi-supervised manner

Generative AI : Some examples

- Chat GPT, Bard
- The search suggestion on internet browsers
- Tools like Grammarly that suggest edits and text generation
- Image generation (GANs)
- Translations
- Music generation - IBM Watson Beat
- Art, video and game design
- Data augmentation

Artificial Intelligence

Machine Learning

Supervised Learning

Unsupervised Learning

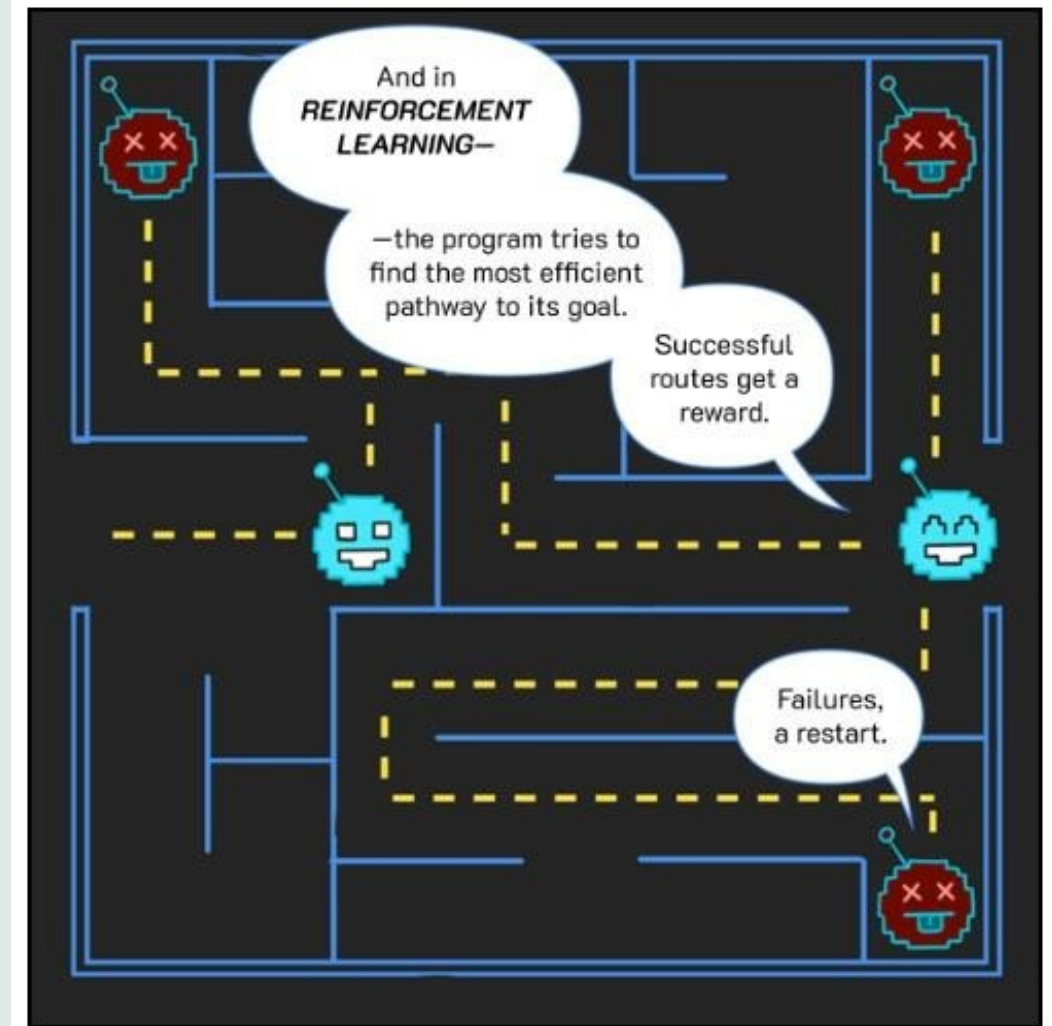

Reinforcement Learning

Deep Learning

Reinforcement learning (RL)

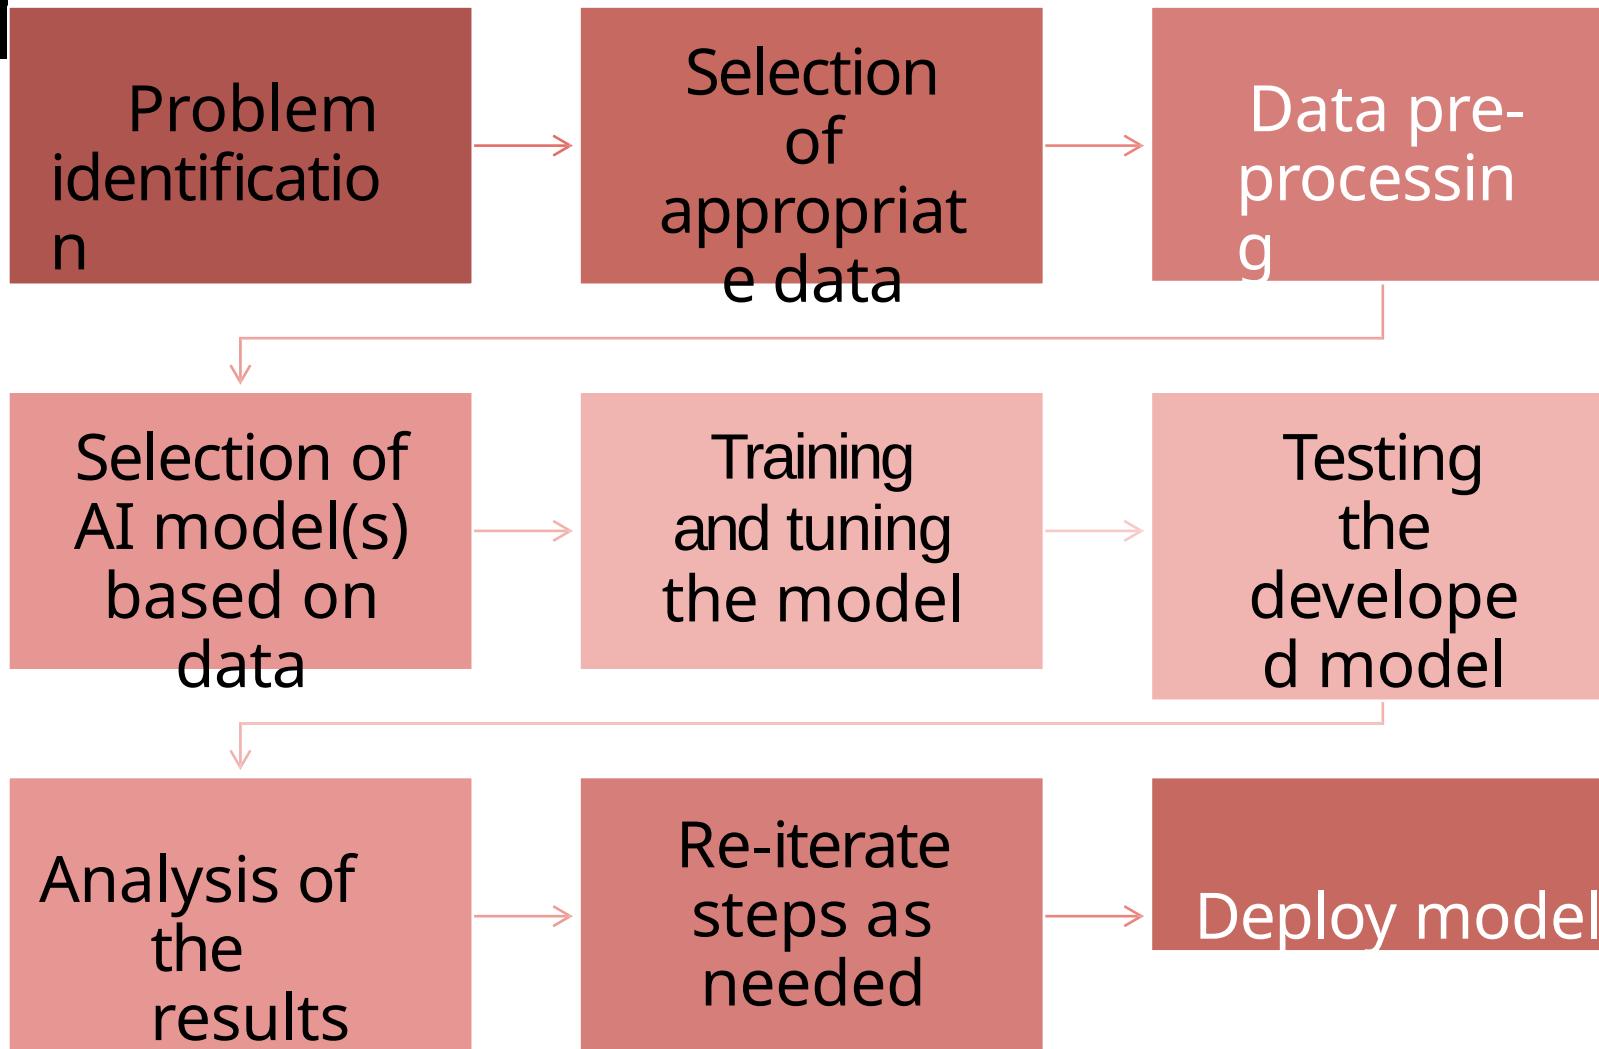

- A set of **states**
- A set of **actions**
- A set of **rewards**
- Goal: take actions to change the state so that you receive rewards
- You don't receive any data – you must explore the environment yourself to gather data as you go

Steps in implementing an AI model

Steps in implementing an AI model

Problem identification & Data curation

Problem Identification

- Experts in the field
- Personal experience
- Literature survey
- Data curation

Data curation

- Data collection in person
- Public repositories
- Private repositories
- Simulated data
- Synthetic data

Data pre-processing

- The specific steps depend on the type of data used
- Size of the dataset
- Visualize the data and labels
- Data cleaning – Remove duplicates or bad samples
- Noise removal

Data pre-processing

- Distribution of data across the classes

Imbalanced data results in a model biased towards the majority class

- Data augmentation
- Resizing the data to meet the model's requirements
- Dividing the data into train, test datasets

Choosing the AI model

1. Problem statement and type of data

Classification, Regression, Segmentation, Augmentation, Feature extraction, etc.

Time series – SVM, RF, LSTM, 1D-

CNN, Images – SVM, CNN

Features – LR, SVR / SVM, RF, MLP, NB, DT

2. Computational capacity

Simpler model or may need dimensionality reduction

3. Try various models to choose best fit or go for ensemble

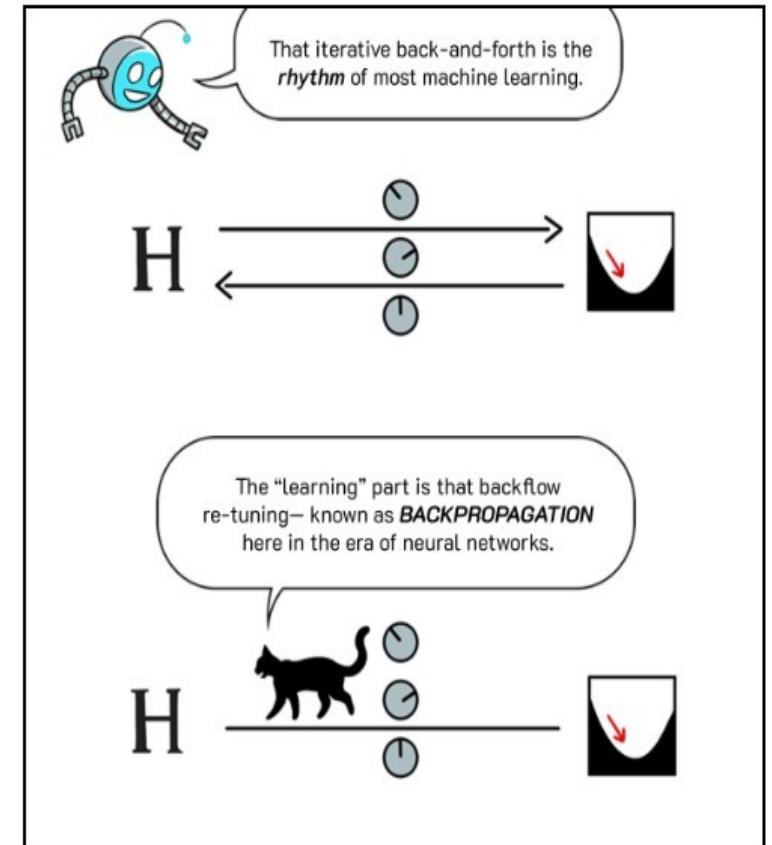

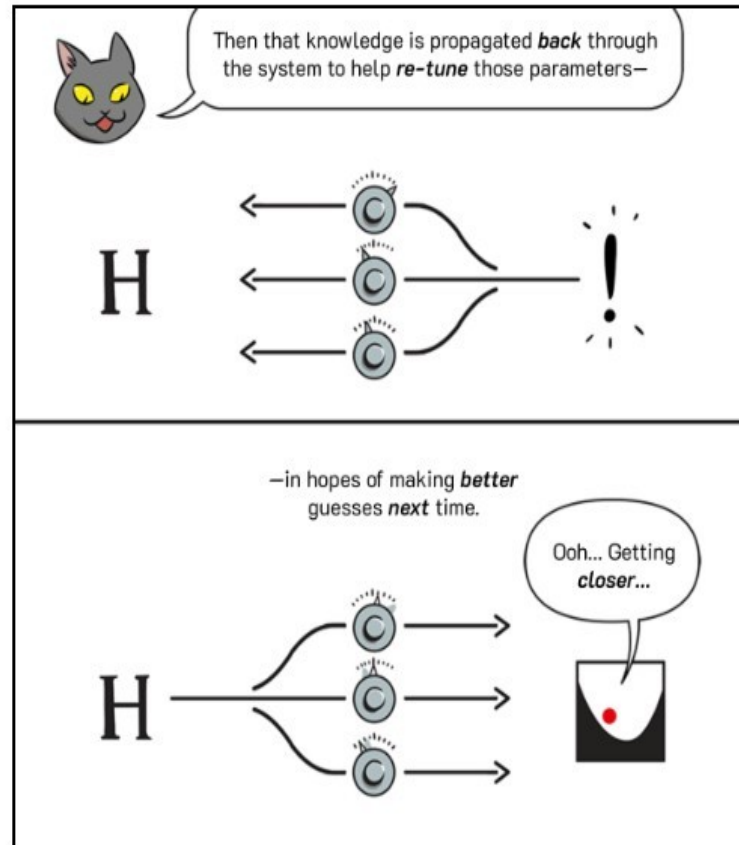

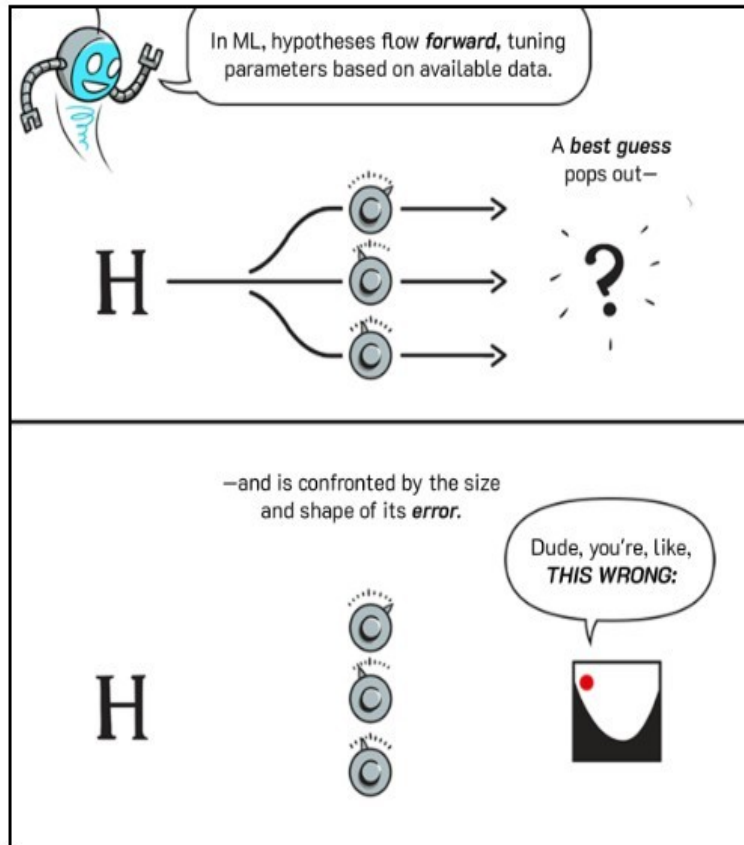

Training the model

- The data split as part of the training subset is passed onto the chosen AI model
- A small portion of the data is retained as the test data, which is used to test the model's learning

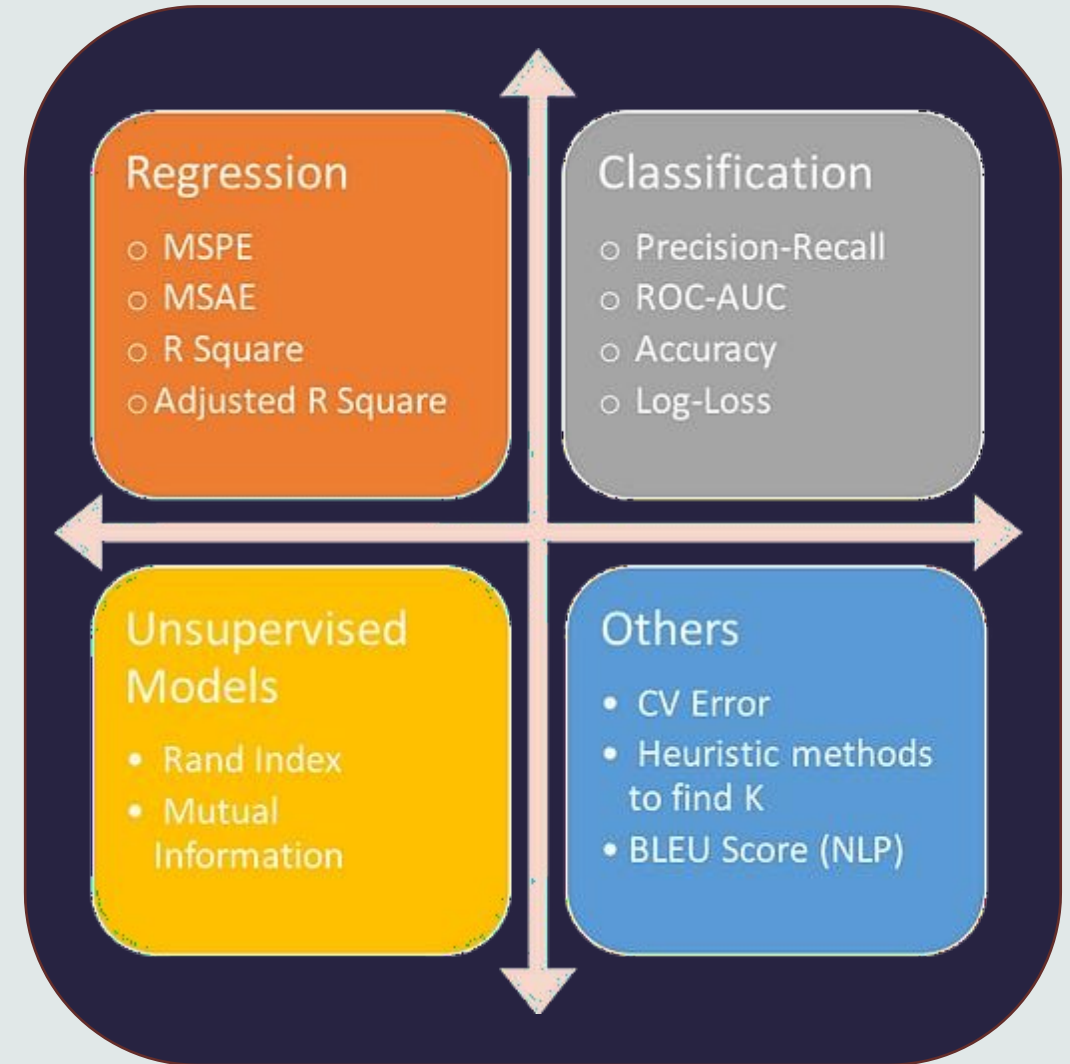

Training or "learning"

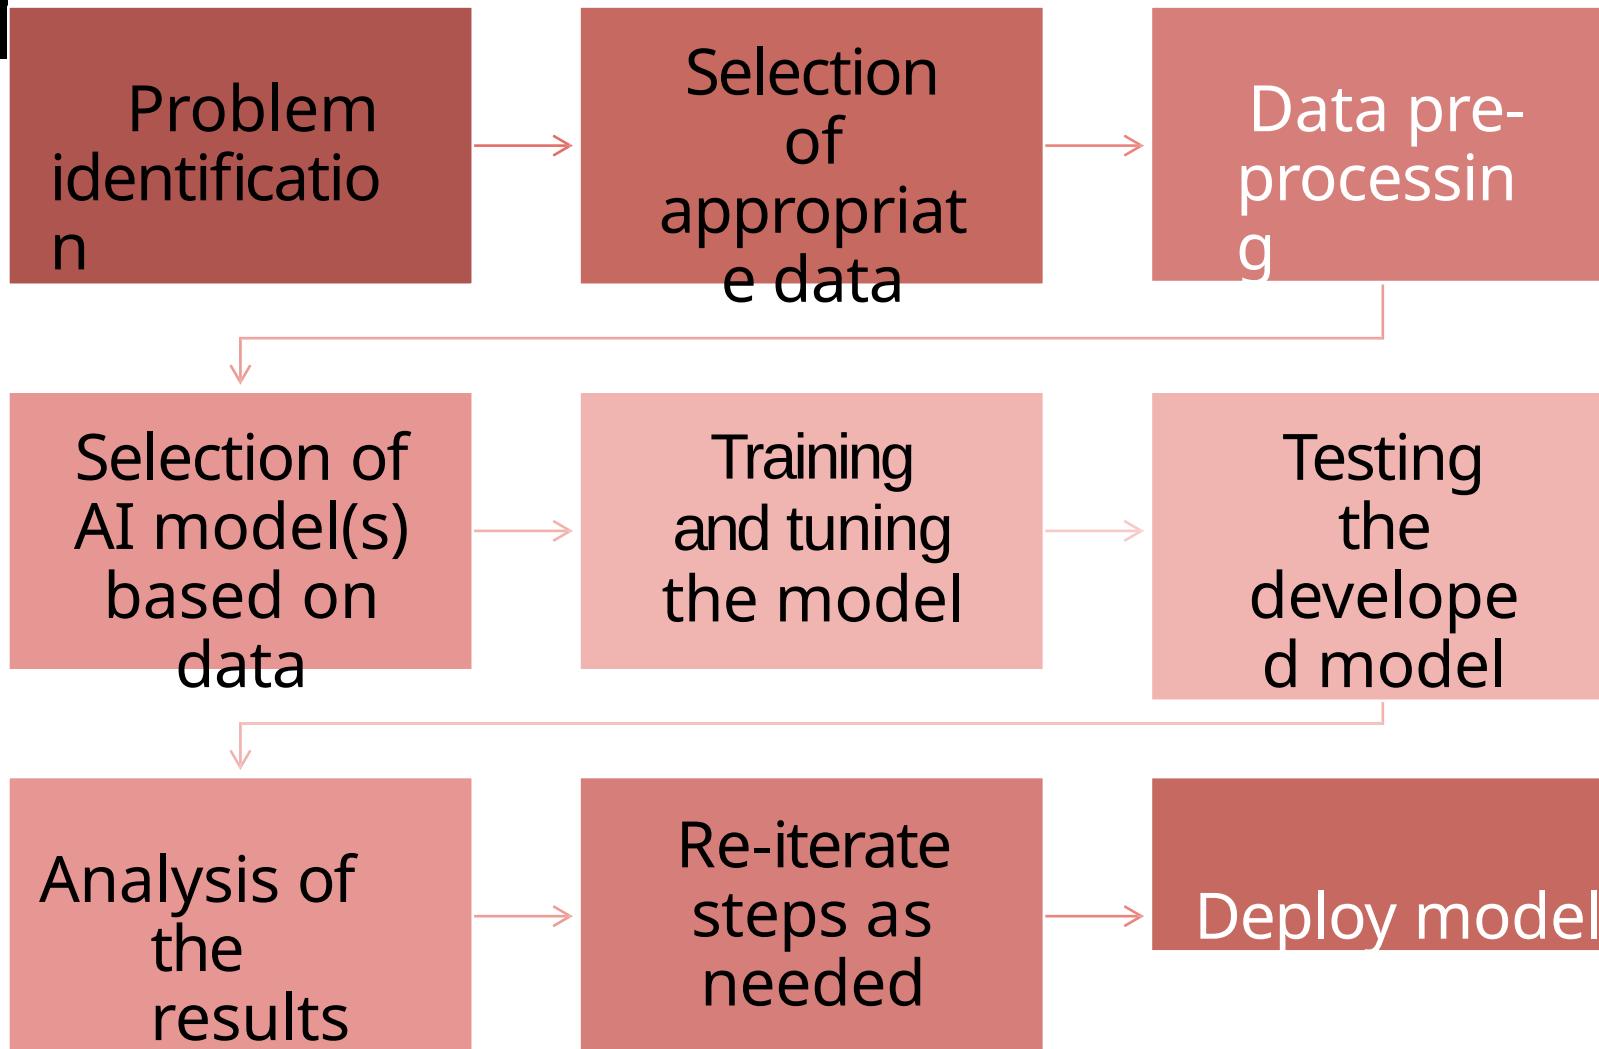

Testing the model

- Choose model appropriate evaluation metrics
- Testing on the hold-out data

Steps in implementing an AI model

Now it's your turn!
Continue your journey into
the world of machine learning...

Thank you!
